

Noman Aslam

Data & Operations Analyst | Lead-Gen BPO Analytics

mnoman.aslam012@gmail.com | 03162804221 | Karachi, Pakistan | Open to remote roles | nomanaslam12.github.io

SUMMARY

Data analyst at a US-facing lead-gen BPO since June 2024, currently leading data and reporting. Analysis on dialer performance and client retention goes to the GM and gets acted on: a DID study challenged a standing 75-calls-per-DID rule, and root-cause reports changed targeting for multiple clients. Works in Power BI, Looker Studio and Excel (Power Query), with SQL in PostgreSQL and SQL Server.

SKILLS

Tools: Power BI, Looker Studio, Excel (Power Query, Power Pivot), Google Sheets, PostgreSQL, SQL Server (T-SQL), n8n, Groq API, Git

Methods: Root-cause analysis, trend and variance analysis, scenario modelling, correlation and R^2 , cohort and RFM segmentation

Domain: Lead-gen BPO operations, dialer performance, campaign diagnostics, client retention

WORK EXPERIENCE

TL - Data & Report | Propstar Technologies, Karachi

Jul 2025 - Present

- Built a DID allocation optimization model that lifted dialer connectivity ~5%, cut spam-driven call drops ~10% and brought ~95% of numbers to clean (non-flagged) status.
- Maintain a daily campaign diagnostics tool auto-emailed to the GM, backend manager and assignment team. It lists the bottom-20 connectivity campaigns and flags live assignment errors each morning.
- Ran a formal DID impact study (R^2 , correlation, variance) and found no statistical support for the standing 75-calls-per-DID rule; presented to the GM for strategy review.
- Built a 5-layer RCA framework used to recover at-risk client accounts; multiple clients acted on the revised targeting.

Campaign Optimization Lead | Propstar Technologies, Karachi

Nov 2024 - Jun 2025

- Reduced Calls per Lead from 200 to 140 through campaign switching strategies across 150+ callers.
- Built a US State Capacity model across 39 states (median call volume, rolling 3-month efficiency, variance analysis, confidence tiers) that leadership used for caller allocation decisions.
- Modelled 0%, 50% and 100% consign allocation scenarios; the review supported management's continued use of a moderate, controlled allocation.
- Directed a 3-person team to streamline campaign assignment workflows and remove bottlenecks in scheduling and group allocation.

Data Analyst | Propstar Technologies, Karachi

Jun 2024 - Oct 2024

- Built Excel and Looker Studio dashboards on caller productivity and campaign performance, delivered weekly to leadership for resource allocation.
- Ran dialer diagnostics (trend and variance) that separated agent-side degradation from infrastructure issues, which narrowed the investigation and directed the operational response.

Shift In charge | ASG Metals Limited, Karachi

Jun 2019 - Jun 2023

- Managed production shifts of 20+ workers to operational and safety targets; replaced a manual production report with an Excel-based one.

KEY PROJECTS

- Lead Commitment Dashboard v2 (Looker Studio, Google Sheets).** Sales managers were quoting lead commitments off a single national CPL of 200. On 15 months of state-level data, CA and WA ran 55-60% above that benchmark. Built a rolling 90-day CPL benchmark per state, an 80% commitment floor, a Recommend / Watch / Do not commit status and a 3-month weighted CPL forecast. In active use by the sales team.
- RFM Customer Segmentation (PostgreSQL).** Stacked CTEs and NTILE(5) scoring on 49,487 customers. Found 6,878 At Risk (High Value) customers holding \$56.9M (27.6%) of historical revenue that LTV-only segmentation had grouped with active spenders. Checked NULL handling, ties and 91 boundary cases (0.18%). Self-directed project on a public dataset.
- Customer Cohort and Retention Analysis (PostgreSQL).** Segmented customers by LTV percentile, built cohorts by first-purchase year and measured churn. High-value customers (25% of base) drove 66% of revenue, and retention stayed at 8-11% across nearly all cohorts.
- End-to-End Data Warehouse (SQL Server, GitHub).** Bronze/Silver/Gold pipeline with T-SQL stored procedures, ROW_NUMBER() deduplication and a Star Schema (Fact Sales, Dim Customers, Dim Products). Bikes accounted for 69% of revenue in the gold layer.
- WhatsApp Campaign Reporting Assistant (n8n, Groq, Google Sheets).** A WhatsApp message with a campaign and date range returns a formatted performance report. Ratios are recomputed from summed raw counts, and a deterministic check corrects status labels the LLM gets wrong before sending.

EDUCATION & CERTIFICATIONS

BE, Mehran University of Engineering & Technology (2015 - 2018) | **Power BI, Udemy** (2025) | **Salesforce AI Associate** (2024) | **Salesforce Super badges** (2024)
